Observations

OVERVIEW

This study examines the relationship between exchange rate, inflation, imports, and GDP per capita on household consumption across five ASEAN economies: Brunei Darussalam, Indonesia, Malaysia, Philippines, and Cambodia, using panel data from 2010 to 2024.

Dataset & Methodology

Panel Data Evidence | Stata 17

Dataset Summary

5 ASEAN countries
Brunei Darussalam, Indonesia, Malaysia, Philippines, Cambodia

2010–2024
15 years

75 observations
5 countries x 15 years

Data sources
World Bank dan Bruegel

Variables

Type	Variable	Code	Description
Dependent Variable	Household Consumption	InKRT	Log of household consumption per capita, PPP (constant 2021 international \$)
Independent Variables	Exchange Rate	NT	Real Effective Exchange Rate (REER) index
Independent Variables	Inflation	INF	GDP deflator (annual %)
Independent Variables	Imports	IMP	Imports of goods and services (% of GDP)
Independent Variables	GDP per Capita	InPDBK	Log of GDP per capita, PPP (constant 2021 international \$)

Research Workflow

Final model: Fixed Effects Model with Driscoll-Kraay standard errors

Statistical Results & Key Findings

Regression Results		
Variable	Coefficient	Direction
Exchange Rate	-0.0082	Negative
Inflation	-0.0027	Negative
Imports	+0.0116	Positive
GDP per Capita	+0.8990	Positive

Within R-squared
0.8025

Selected Model
FEM

Final estimation: Fixed Effects Model with Driscoll-Kraay standard errors.

Estimated Effects on Household Consumption

i Statistical Note: Coefficients use different measurement scales and should not be compared directly by magnitude. Significance testing follows pre-specified one-tailed hypotheses.

Insights, Implications & Skills

Key Insights

Macroeconomic Stability

Exchange rate and inflation are associated with household consumption and may influence economic stability in ASEAN economies.

International Trade

Imports are linked to stronger household consumption, suggesting the role of access to goods and services in domestic welfare.

Economic Capacity

Higher GDP per capita is positively associated with household consumption, reflecting the relationship between economic capacity and household purchasing power.
